9/10

the ASP used two XSL filters. First - [the default one](#) - formats the start page, showing a list of locales that server supports. The second, [single-language filter](#), formats a language-specific page; it receives a single - language subset of the XML data that ATL.

The data sent is multi-lingual and encoded in UTF-8. Certain problems may show up when multi-lingual data is displayed on non-multilingual platforms. To resolve some of those problems, a Unicode font was created from Sylfaen font supplied with Microsoft Windows 2000. This font is embedded into the output HTML, so that you see less "default glyphs" (result of system's failure to find a symbol to display text) in the output. However, this solution works only with Microsoft Internet Explorer 4.0 or better. For more information on this technique and for the tool that generates Web fonts, check the link:  
<http://www.microsoft.com/typography/web/embedding/weft3/default.htm>.
